

Results packet: what passed, what did not

Execution-only and synthetic evidence; historical transfer withheld until authorized

Gate summary

Gate	Result	Interpretation
A1 exactness	True	World and continuation state must both match.
A2 authority	True	Every runtime field classified exactly once.
A3 kernels	True	Physical and information numerical oracles.
A4 profile	True	Representative diagnostic profile.
A5 E1	False	Minimum 4 PWB/s.
A5 E2	False	Target 10 PWB/s; not a gate.
B synthetic	True	History-free inference validation.

Fixed workload definition

The fixed workload is 32 particles, 8 weekly boundaries, and 3 branch-equivalents: 768 particle-week-boundaries per measured repeat. The benchmark records wall time, workers, source payload, model hash, and the exact synthetic observation rule. It is not acceptable to infer a passing rate from a smaller run.

Current fixed-work result: incomplete resource-limit run; no PWB/s is reported, and E1/E2 are failed closed. The complete-ensemble rule is active.

Synthetic validation interpretation

The passing v2 synthetic result supports the numerical inference machinery under its preregistered data-generating process. It does not validate the historical observation operator, case geography, or empirical construct mapping. Those remain separate gates.

No partial ensemble rule

If a seed, branch, worker, or weekly boundary is missing, the ensemble is incomplete and no aggregate historical result is reported. This packet follows that rule by reporting unavailable gates as unavailable rather than filling them from prior artifacts.
