

Limitations and failure ledger

Open issues are explicit work items, not hidden caveats

Failure ledger

Item	Observed state	Action
Stale core certificate	The prior v5 certificate model hash does not equal the live model hash.	Do not recertify silently; bind future evidence to the live source.
Guided v1 synthetic validation	ESS ratio was below its preregistered threshold.	Preserve the failure; v2 is a declared protocol revision with unchanged thresholds.
Historical confrontation	historical_confrontation_not_authorized	Run only after phase C authorization and only once.
Robustness	robustness_synthetic_only	Synthetic checks are available; historical robustness is gated.
Throughput	The exact 768-PWB workload exceeded the controlled resource window before completion.	No PWB/s is reported; optimize synchronization/transport and rerun the complete workload.

Scope limitations

The theory is a compact latent-state account, not a universal theory of insurgency. Historical observation operators can be weakly identified. Case geography can encode assumptions. Sparse historical evidence is not treated as a complete measurement of latent control or civilian harm. Negative evidence and missingness remain part of the evidence model.

Reproducibility limitations

The current working tree contains existing study artifacts and live source changes. The contract records the exact dirty paths and tracked-diff hash. Reproduction requires the same Python/native runtime family, protocol files, seeds, and model hash.

Review checklist

An independent reviewer should: verify every file hash; rerun A1-A4 and B; inspect the fixed-work benchmark rather than extrapolate; confirm the contract has not authorized history prematurely; and reject any claim that exceeds the disposition matrix.
