

Claims and evidence matrix

Every proposed statement is classified as supported, limited, or withheld

Claim	Evidence	Disposition
The packed runner can reproduce the reference scheduler in the preregistered battery.	A1 exactness and continuation hashes.	Supported if A1 PASS; otherwise withheld.
Packed state authority is explicit and auditable.	A2 field inventory and sparse-boundary ledger.	Supported if A2 PASS.
Synthetic inference machinery recovers known quantities under the protocol.	B v2 coverage, RMSE, variance, MCSE, combined gates.	Supported for synthetic worlds only.
The model explains Nepal or Afghanistan.	No authorized current-core confrontation in packet.	Withheld.
Historical transfer is robust to observation operators.	No current authorized historical run.	Withheld.
The implementation is production throughput ready.	A5 fixed-work benchmark.	Use current measured gate only; no extrapolation.

Evidence hierarchy

Source code and test results establish implementation behavior. Synthetic artifacts establish recovery under the declared data-generating process. Historical case artifacts would establish only case-specific predictive confrontation under the frozen contract. No level is substituted for another.

Negative evidence

The earlier guided synthetic validation that missed its ESS threshold remains a first-class result. The old v5 historical artifacts remain preserved but stale relative to the current model hash. A missing current historical run is not interpreted as success or failure of the scientific theory.
